DEBRIS TRAP SERIES CLEANING & MAINTENANCE

APPLICABLE PRODUCTS

Debris Trap: Roll, Tile, Everest, Supreme, Extreme, Tundra

ROUTINE CLEANING – VACUUMING

1. Equipment – Use a vacuum with high suction and/or wet-dry vacuum (a vacuum with beater-bar or brushes may be recommended).
2. Method – Slow deliberate vacuum passes are more effective. A minimum of four passes, forward and back, are recommended for effective soil removal.

3. Frequency

Mat Area	Vacuuming
Heavy Traffic	Daily
Medium Traffic	Every Other Day
Light Traffic	Once or Twice a Week

DEEP CLEANING – MAT REMOVAL

1. Equipment – Use a vacuum with high suction that is for wet/dry as needed. For Debris Trap Roll and Tile products, a high pressure hose may be used if necessary (not to exceed 60 PSI).
2. Method – Remove and clean Debris Trap product. Clean substrate surface; be sure to extract all debris. It is also recommended to vacuum the product when doing the deep cleaning.

Note: Failure to remove all debris from beneath matting could cause injury and may result in excess wear which could void your warranty.

3. Frequency

Mat Area	Vacuuming
Heavy Traffic	Once a Week
Medium Traffic	Twice per Month
Light Traffic	Once per Month

MONITORING YOUR MATTING

Do a walk-through inspection of all areas monthly. For optimum appearance and protection of your matting, it may be necessary to adjust the frequencies of vacuuming and deep cleaning.
